The Invention Felses to desecting (M1) granulocyte (GC) activation to the level of expression of expression of expression of expression of GB) identified by MA chip analysis as given in the specification, and comparing the expression level in an unactivated GC, where differential expression of GB is indicative of GGA. Also included are according M2) GA by contacting GC with an agent that alters the modulating GA or an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a profile; (3) detecting (M4) an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the level of expression in a sample of the tissue of gene(8) from GB, where the level of expression in a sample of the tissue of gene(8) from GB, where the level of expression in a subject, exposure of a subject to a pathogen or sterile inflammation (especially chronic) or in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation (especially chronic) or in a tissue, an allergic cresponse in a subject, exposure of a subject to a pathogen or sterile inflammation in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation in a tissue, an allergic response in a subject or exposure of a subject to a pathogen or sterile inflammation in a tissue, an allergic response in a subject to a pathogen or sterile inflammation (especially chronic) in a tissue, an allergic response in a subject to a pathogen or sterile inflammation in a tissue, an allergic response in a subject to a pathogen or sterile inflammation in deservable to the pathogen or sterile inflammation (especially chronic) in a tissue, an allergic response in a subject to a pathogen or sterile inflammation injury, renal response in a subject to a pathogen or sterile inflammation injury, renal respectable in faction and Ms is useful for treating one of the
                                                                                                                                                                                                                                                                                                                        Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    invention relates to detecting (M1) granulocyte (GC) activation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor by: (1) determining a pattern of expression in the ovarian tumor of several markers given in the specification; and (2) comparing a similarity of the pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in a comparison tissue of a known BRCA-1-like or BRCA-2-1ike or non-BRCA-like tumor. The method is useful for classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor. This sequence corresponds to an ovarian cancer -related gene having an attered pattern of expression in ovarian cancer. (Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor by determining a pattern of expression in the ovarian tumor of several markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120

(INCY-) INCYTE CORP.

Seilhamer JJ; Cocks BG, Stuart SG,

WPI; 2003-895307/82.

A composition comprising a plurality of CDNAs, useful for detecting altered expression of genes in an immunological response or for diagnosing and treating an immunopathology, e.g. Crohn's disease, asthma osteoarthritis.

Claim 1; SEQ ID NO 899; 50pp; English

The invention relates to a composition comprising a plurality of cDNAs for detecting the altered expression of genes in an immunological response. The invention also relates to a method of diagnosing or monitoring the treatment of an immunopathological condition in a sample, comprising obtaining nucleic acids from a sample, contacting the nucleic acids of the sample with an array comprising the plurality of cDNAs under comprising to form one or more hybridisation complexes detected in the non-diseased sample, where an altered level of the detected hybridisation complexes with the level of hybridisation complexes (conditioning to complexes or an anon-diseased sample, where an altered level of the detected hybridisation complexes correlates with the presence of an immunopathological condition. Also disclosed are an expression profile (hybridisation complexes or plurality of detectable complexes and a macroarray and a plurality of detectable complexes and a method for identifying a plurality of polynucleotide probes. The cDNAs are useful as hybridisable array elements in a microarray for monitoring the expression of target polynucleotides. The microarray for monitoring the expression of target polynucleotides. The microarray can be used in drug discovery and development, toxicological and carcinogenicity studies, foreneises or pharmacogenomics. The composition of as subpopulation of max also be used in fung discovery and development, toxicological and carcinogenicity studies, foreneises or pharmacogenomics. The composition may also be used in purification of a subpopulation of max, of the printed specification but was obtained in electronic format directly from USPTO at sequence cate for this patent did not form part of invention. Note: The sequence cate in the printed specification but was obtained in electronic format directly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of classifying a breast cancer patient according to prognosis by determining the similarity between the level of expression of each of five genes for which markers are listed in the specification, in a call sample taken from the breast cancer patient, to control levels of expression for each respective five genes to obtain a patient similarity value. The methods are useful for classifying a breast cancer patient according to prognosis. Kits and computer program products are useful for data analysis using the diagnostic, prognostic and statistical methods of the invention. This sequence corresponds to a marker used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         80
                                                                                                                                                                                                                                                                                                                                              This sequence encodes human cyclin I. Antisense polynucleotides are useful for as probes and can be labelled and used for detection of neurones by hybridisation with manNA for cyclin I (contained in the neurones and arising by the expression of the cyclin I gene in these cells). The gene can be used for detection of cancer cells by detecting the expression of the cyclin I gene in these specific for the fragments of the protein (especially ANW21966) can be used for detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SerProSerGlnArgAspGluVallleGlnTrpLeuAlaLysLuLysTyrGlnPheAsn

                                                                                                                               The invention relates to prostate selective polynucleotides and polypeptides. The polynucleotides are expressed in prostate and are useful as molecular markers, as drug targets, and for detecting, monitoring, preventing or treating diseases and conditions related to prostate, such as prostate cancers. Sequences ACC47125-356 represent specific examples of prostate specific polynucleotides
                                                                                                                                                                                                                                                                                                    MetLysPheProGlyProLeuGluAsnGlnArgLeuSerPheLeuLeuGluLysAlaIle
                                                                                                                                                                                                                                                                                                                                                                                                           LeuTyrProGluThrPheAlaLeuAlaSerSerLeuLeuAspArgPheLeuAlaThrVal

                                            ò
and immunostimulants; and a polypeptide (II) of a ovarian tumour polypeptide encoded by a polynucleotide (III) having a CDNA sequence (S1) from the 10912 nucleotide sequences as given in ABL77021 to ABL87934, (III) encoding (III) having a sequence (S2), a cell population of (III), or antigen presenting cells that express (II). (I) has cytostatic activity. An oligomoucleotide (IV) that hybridises to (S1) can be used for detecting ovarian cancer in a patient's biological sample preferably serum or ovarian tissue. The method comprises contacting a biological sample from a patient with (IV), detecting the amount of polynucleotide hybridising to (IV) is detected preferably by amount of polynucleotide hybridising to (IV) is detected preferably by colue and thereby detecting ovarian cancer in the patient, where the amount of polynucleotide hybridising to (IV) is detected preferably by collymerase chain reaction (PCR). (I) comprising (III) and/or expending T cells specific for an ovarian tumour protein comprising contacting T cells with (III) or (III) is useful in design and preparation of riboxyme molecules for inhibiting contacting a cuitable library e.g., a tumour cDNA, library using well known techniques

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1144
        rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, and stem cell transplant rejection, in an individual. The method is also useful in assessing the immune status of an individual. The method is also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple selerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a mRNA reference sequence for a 50 mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GATCTTCACACACACACACCATTGGATTTTCTTCATATTTTCCATGCCATTGCAGTGTCA 1024

polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide polypeptides at least 80% identical to the TAT nucleic acids and polypeptide expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, cervical cancer, liver cancer bladder cancer, pancreatic cancer, cervical cancer, liver cancer bladder cancer, pancreatic cancer, cervical cancer, cancers of the central cancer, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence represents a TAT nucleic acid of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAGGCTCATCCAAAATACTTGAGTTGTATTGCAATCAGCTGTTTTTTCCTAGCTGCCAAG 844

```
Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                              ovarian cancer; ds; tumour; cytostatic; DNA marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; SEQ ID NO 21586; 106pp; English

The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-cancerous) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the concerous) ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient antisense oligonuclectide complementary to a marker of the patient an antisense oligonuclectide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of the marker in a patient sample and a normal level of expression of the marker in a patient sample and a normal level of expression of the carresponds to a secreted protein or to a transcribed polymuclectide or its portion. The level of expression of the marker is a sessessed by detecting the presence in the sample, a protein or protein ciragment is detected using an antibody that specifically binds with the protein or protein fragment. Alternatively, the level of expression of the marker is assessed by detecting the presence of a transcribed comprising to the marker. The presence of a transcribed concernment is assessed by detecting the presence of a transcribed comprising to the marker or anneals with the level of expression of the polynucleotide which anneals with the presence of a transcribed comprising the marker or anneals with the marker is also used for monitoring the presence of a transcribed comprising the marker is a subsequent of expression of the marker is a subsequence of a transcribed of the marker is an end comparing the presence of the marker in a practicular which involves detecting expression of the marker is a subsequence. 3 an ovarian tissue sample. A composition comprising a marker, septide or antibody of the invention is used to treat ovarian cancer. sequence represents a human ovarian cancer DNA marker of the polypeptide or antibody of This sequence represents

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel cell growth, differentiation and death (CGDD) proteins and polynucleotides encoding them. The sequences of the invention are useful in diagnosing, preventing and treating disorders associated with an abnormal expression or activity of CGDD such as seciated with an abnormal expression or activity of CGDD such as neurodegenerative disorders (e.g. Parkinson's disease, Alzheimer's disease), macular disorders (e.g. parkinson's disease), cancers (e.g. disorders (e.g. diabetes (g.a. diabetes) (annunological disorders (e.g. lukaemia, cervical or breast cancers), immunological disorders (e.g. scleroderma, systemic lupus erythematosus, allergies), gastrointestinal scleroders (e.g. crohn's disease), renal disorders (e.g. Goodpasture's syndrome), infections (e.g. viral, bacterial, fungal, parasitic, protozoal, helminthic), cardiovascular disorders (e.g. atherosclerosis) protozoal, diseases (e.g. viral, paterial, fungal, parasitic, and hepatic diseases (e.g. viral, paterial). The polynucleotides can be used to create humanised animals or transgent animals to model human diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            243

           Human
```

The invention comprises the amino acid and coding sequences of human (CGDD). The DNA and protein sequences of the invention are useful for diagnosing, treating or preventing disorders associated with aberrant expression of CGDD, such as: cell proliferative disorders (e.g. arterioscierosia, atheroscierosis, bursitis, cirrhosis, hepatitis, polycythaemia vera, psoriasis and cancers), developmental disorders (e.g. cushing's syndrome and hypothyroidism), neurological disorders (e.g. cushing's stroke, Alzheimer's disease, pick's disease, Huntington's disease, Parkinson's disease and multiple sclerosis), autoimmune/inflammatory disorders (e.g. Alzheitis and diabetes mallitus), and reproductive disorders (e.g. autoimmune/inflammators) and resine fibroid), The present DNA sequence encodes a human CGDD-associated protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-ancernal) ovarian calls. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the neoded by the markers, antibodies that selectively bind to the collectively bind to the corresponding to a marker of the invention and a method of treating a patient antisense oligonuclectide complementary to a marker of the patient an antisense oligonuclectide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of the marker in a patient sample and a normal level of expression of the marker in a control non-ovarian cancer. The level of expression of a marker corresponds to a secreted protein or to a transcribed comparing to the marker. The presence of protein or protein cancer is assessed by detecting the presence in the sample, a protein or protein cancer is assessed by detecting the herence in the sample, a protein or protein cancer is assessed by detecting the presence in the sample, a protein or protein cancer is assessed by detecting the presence of a transcribed comparised by the marker or anneals with the marker or anneals with the marker or anneals with a portion of the marker is assessed by detecting the presence of a transcribed comprisation the propression of the marker is a sessessed by detecting the presence of a transcribed comprisation which anneals with the marker, under stringent conditions. The marker is also used for monitoring the progression of the marker in a partion of the marker. The presence of a transcribed comprisation and an antibody that specifically binds with the marker in a partion of the marker in a partion of the marker in a partion of the progression of the progression of the partion in a partion of the profession of the profession of the partion which is partion of the profession
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 patient which involves detecting expression of the marker in a patient sample at a first point in time, repeating the method at a subsequent time and comparing the level of expression. The method is carried out using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer. This sequence represents a human ovarian cancer DNA marker of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.

New isolated cancer associated nucleic acids and polypeptides - isolated using sera from cancer patients, used to develop products for the diagnosis, monitoring or treatment of cancers.

Claim 67; Page 630; 787pp; English

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions of hardcreinsed by the expression of various cancer associated antigens. The invention are cancer associated antigens which are cancer associated antigen precursors expressed in human breast cancer. cancer lung

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 5973119

GENERAL INFORMATION:

APPLICANT: Coats, Steven R.

APPLICANT: Bass, Michael B.

APPLICANT: Robinson, Murray O.

TITLE OF INVENTION: No. 5973119el Cyclin E Genes and Proteins

FILE REFERENCE: A-524

CURRENT APPLICATION NUMBER: US/09/092,770

CURRENT PILING DATE: 1997-06-05

NUMBER OF SEQ ID NOS: 18

SOPTWARE: PatentIn Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               301 ArgGlyThrAlaAlaPheTyrHisHisLeuPro 311
